

Item #: SCP-113

Object Class: Safe

Special Containment Procedures: SCP-113 is to be kept in standard storage in Site 23. SCP-113 may be handled with laboratory gloves. No organism may be exposed to SCP-113 without prior approval. Personnel exposed to SCP-113 are to be kept under medical observation for 7 days.

Description: SCP-113 resembles a small, polished piece of red Jasper. Analysis shows that SCP-113 is not composed of Jasper, but (REDACTED) composition similar to that of other recovered objects.

When SCP-113 comes in direct contact with the flesh of an organism (providing one chromosome), the organism's physical characteristics associated with gender and biological sex are transformed (including genetics and secondary sexual characteristics), either reversed or altered. This process occurs in four stages:

Stage 1: Lasts approximately 6.2 seconds. SCP-113 bonds with the cells that it touches and induces an accelerated chemical change. This process causes tissue damage similar to acid burns, and SCP-113 cannot be removed from contact with the subject until all stages complete.

Stage 2: Lasts approximately 20 seconds. SCP-113 emits a low-intensity electromagnetic wave which travels through the subject's body. Subjects may experience nausea and vomiting, along with a dropping sensation throughout the body.

Stage 3: Lasts approximately 60 seconds. Throughout this stage, the subject's cellular makeup is transformed. Altered cell composition ranges widely from being indistinguishable as human, to a unique variation of partially-differentiated stem cells. The subject will experience intense stimulation of all sensory nerves during the final 20
